

Mould Remediation

Mould is an increasing problem in all buildings and constructions. Tightly built houses, together with insufficient ventilation, incorrect weather shields or water damage create mould growth. Mould spores are all around us and often cause little inconvenience. However, when these mould spores come into contact with wet or moist surfaces they start to germinate and create health concerns.

*It is almost impossible to kill mould or bacteria, but **Remeed Solutions** has developed an environmentally friendly method that removes the mould from the surfaces without using toxic chemicals that can cause secondary problems.*

*The Environmental Protection Agency and other experts on mould mitigation state that, “moisture control is the key to mould control”. **Remeed Solutions’** Moisture Control Service offers vast knowledge, experience and technical expertise in addressing mould problems.*

Procedure

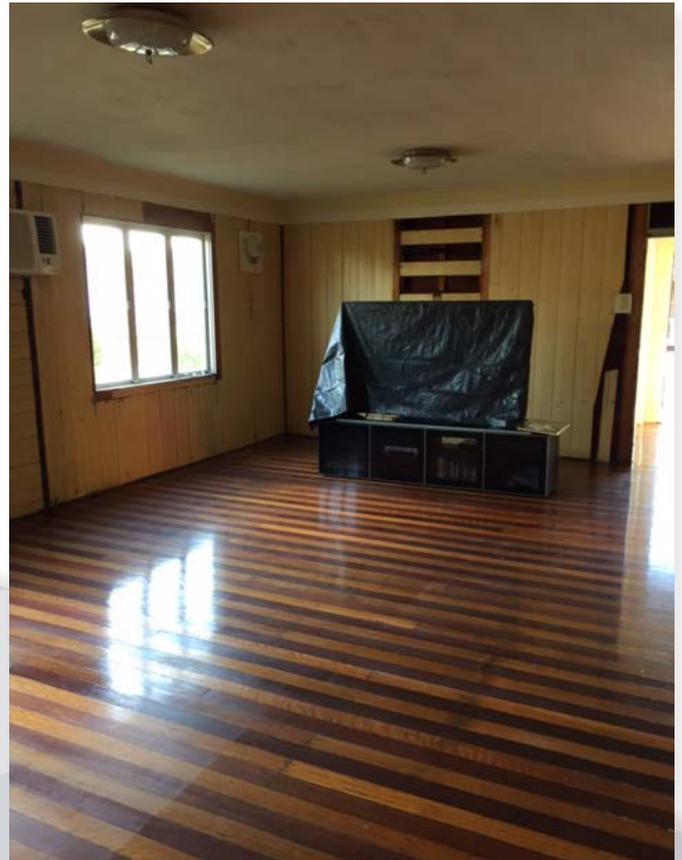

A **Remeed Solutions** technician will first visit the affected site to evaluate the extent of the damage. The customer is then made aware of the parts of the building that are already affected by mould growth and areas where mould problems can be prevented by using the comprehensive drying process.

Once the evaluation is complete, a comprehensive project plan is developed that is consistent with industry standards and regulations and includes drying, demolition and measurement.

Remeed Solutions technicians work with state-of-the-art equipment for drying, filtering and decontaminating the affected areas. If containment procedures call for the removal of affected materials, this will be implemented and steps will be taken to prevent migration of mould spores to unaffected areas.

A system involving airflow (negative pressure) and EPA filtration will be used to properly dry and decontaminate the affected area.

Once drying and mitigation are complete, **Remeed Solutions** will provide documentation stating that the area has been thoroughly dried and remediated. When necessary, **Remeed Solutions** will also work with

third-party health professionals using post-abatement testing to establish that the project has been successfully completed.

Following flood or water damage, buildings and properties are subject to serious issues from mould and other microbiological contamination. With experience in recovery projects, Remeed Solutions are able to ensure the most efficient recovery of both buildings and items.
