

Odour Control

Odours left behind after fire or floods can be very difficult to remove and be extremely distressing to property owners. If these odours are not eradicated using the correct applications they will linger and be a constant reminder of the initial stressful event that caused the damage.

Remeed Solutions' technicians recognise the need to thoroughly deodorise properties after the decontamination and drying procedures in order to rid the properties of the odours that prevent the property owner from reoccupying their property.

Our technicians understand that odours can become trapped in pours of the building fabric, vents, ducts and inaccessible areas and have a range of products to remove odour in all circumstances.

Whether the property has suffered fire or flood damage, it requires thorough decontaminated and drying before the technicians can begin the deodorisation process. Porous materials such as loft insulation can absorb odour to such an extent that they are required to be removed from the building to be cleaned effectively.

Remeed Solutions have a number of applications for odour control:

Thermal fogging - used for deodorising properties after fires. The vapour consists of molecules small enough to infiltrate all possible areas that smoke would have, thus eliminating all traces of the odour.

Ozone (O³) - ozone generators produce Ozone by passing oxygen through an electrical field. Ozone is a very powerful oxidant which oxidises organic and inorganic material in the air, including bacteria, viruses, microbes and fungal spores. After the oxidising process, the ozone converts back to oxygen making it one of the most effective methods of deodorising any area, be it domestic or commercial.

Wet Fogging - wet fogging is used as an odour control to eliminate smoke and organic smells. It provides effective deodorisation and disinfecting by spraying mist which bonds to the surface.

When the restoration process is completed thoroughly, the technician can begin the process of removing the odour using the appropriate applications. This process requires the property to be vacated and can only be undertaken by our fully trained and qualified **Remeed Solutions** technicians.
